→ Pearson Residuals: $r_{ij} = \frac{C_{ij} - \hat{C}_{ij}}{\sqrt{\hat{C}_{ij}}}$
mosaic plots: see notes
 $\hat{C}_{ij} \rightarrow$ see notes for formula

Last Time: Contingency Tables

Var1

category

Var2

cat

1 2 ... K2

1	C_{11}	C_{12}	...	C_{1K_2}	$n_{1\cdot}$
2	C_{21}	C_{22}	...	C_{2K_2}	$n_{2\cdot}$
...
K_1	$C_{K_1 1}$	$C_{K_1 2}$...	$C_{K_1 K_2}$	$n_{K_1 \cdot}$
	$n_{\cdot 1}$	$n_{\cdot 2}$...	$n_{\cdot K_2}$	n

→ row sums

→ Marginal distn of Var1

whole thing: joint distn

single row (row i)

cond distn of Var2 | Var1 = i

single column (column j)

cond distn of Var1 | Var2 = j

marginal distn of Var2 (col. sums)

odds = success : failure

		Var 2	
		yes	no
Var 1	yes	A	B
	no	C	D

$A = C_{11}$ $B = C_{12}$...

$prob = \frac{\# \text{ of ways to succeed}}{\text{total } \# \text{ of ways}}$
 $odds = \frac{\# \text{ of ways to SUC}}{\# \text{ of ways to Fail}}$

Special Case: 2x2 Contingency Tables & Odds Ratios

Two Categorical Variables: Two categories each

Var 1 $\begin{cases} C_1 \\ C_2 \end{cases}$ Var 2 $\begin{cases} C_1 \\ C_2 \end{cases}$

Odds Ratio: Measures the association in a 2x2 Contingency Table

Give the odds of "success" in Var 2 if we had "success" in Var 1 vs. if we had "failure" in Var 1

- two types of association:
- 1) High #s in A,D } positive assoc.
Low #s in B,C
 - 2) Low #s in A,D } negative assoc.
High #s in B,C

No Association:

1) $P(\text{Var 2} = Y | \text{Var 1} = Y) = P(\text{Var 2} = Y | \text{Var 1} = N)$
 2) $P(\text{Var 2} = N | \text{Var 1} = Y) = P(\text{Var 2} = N | \text{Var 1} = N)$

$OR = \frac{\text{odds of success in Var 2 if Var 1 = Y}}{\text{odds of success in Var 2 if Var 1 = N}}$
 odds ratio

$$\begin{aligned}
 & \frac{P(\text{Var 2} = Y | \text{Var 1} = Y)}{P(\text{Var 2} = N | \text{Var 1} = Y)} \div \frac{P(\text{Var 2} = Y | \text{Var 1} = N)}{P(\text{Var 2} = N | \text{Var 1} = N)} \\
 &= \frac{\frac{A}{A+B}}{\frac{C}{C+D}} \div \frac{\frac{B}{A+B}}{\frac{D}{C+D}} \\
 &= \frac{A/B}{C/D} = \frac{AD}{BC}
 \end{aligned}$$

Four Fold Plot: Displays Assoc. / Odds Ratio in 2x2 Table

- each cell in 2x2 table gets a "fold" (quarter circle) of the plot
- radius $\propto \sqrt{\text{freq.} / \text{cell count} / C_i}$
 - Area $\propto \text{freq.} / \text{cell count} / C_i$

Quick interpretation:

Can add (95%) C.I. bands

No overlap \Rightarrow signif.

does a statistical test for you
